

UE24CS341A – Software Engineering

Lab 2 – Agile Backlog Creation & Sprint Simulation in Jira (Scrum)

Name: Nihar Sureshwar Oak

SRN: PES1UG24CS299

Section: E

Screenshot 1: Scrum Backlog with Sprint Planning

The Scrum backlog displays the work items organized into Sprint 1 and the remaining product backlog. Sprint 1 contains four functional requirements with a total estimate of 16 story points, while three additional requirements remain in the backlog for subsequent sprints.

Screenshot 2: Active Sprint 1 with Completed Requirements

The Active Sprint view shows the four functional requirements included in Sprint 1. All four requirements have been completed and are marked as Done, with each requirement containing two associated subtasks.

Screenshot 3: Sprint Summary with Work Item Distribution

The Sprint Summary displays an overview of the project after completing Sprint 1. It shows the distribution of the 21 total work items by status, type, and assignee, providing a summary of the work completed during the first sprint.

Screenshot 4: Active Sprint 2 with Completed Requirements

The Active Sprint view shows the three functional and non-functional requirements included in Sprint 2. All three requirements have been completed and are marked as Done, with each requirement containing two associated subtasks.

Screenshot 5: Sprint Summary Showing Completed Work Items

The Sprint Summary displays an overview of the project after completing Sprint 2. It shows the distribution of the 21 total work items by status, type, and assignee, reflecting the completion of the work carried out across the second sprint.

Screenshot 6: Sprint 1 Burndown Chart

The Sprint 1 Burndown Chart shows the progress of story points throughout Sprint 1. The chart compares the remaining work against the ideal guideline and indicates the non-working days, showing the gradual reduction of the sprint workload toward completion.

Screenshot 7: Sprint 2 Burndown Chart

The Sprint 2 Burndown Chart shows the progress of story points throughout Sprint 2. The chart compares the remaining work with the ideal guideline and highlights the non-working days, illustrating the planned reduction of the sprint workload toward completion.

Reflection Questions

1. Did your estimations reflect the actual effort?

Yes, the story point estimations provided a reasonable representation of the effort required for the selected User Stories. The Fibonacci based estimates helped compare the relative complexity of the work items. Since the planned stories were successfully completed within the simulated sprints, the estimates were generally appropriate, although the burndown charts show that some of the work was completed in larger batches rather than at a uniform rate.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized according to the importance and user impact of the User Stories. Higher priority items were selected for the sprints first, allowing the team to focus on the most important functionality. The completed stories in both sprints indicate that the prioritization was effective for the simulated project.

3. How did your simulated sprint align with your plan?

The simulated sprints aligned well with the planned work. The selected User Stories were moved through To Do → In Progress → Done, and the planned work for both Sprint 1 and Sprint 2 was completed. The completion of the sprint items indicates that the sprint scope was manageable within the simulated sprint duration.

4. What insights did the burndown chart give about your team's capacity?

The burndown charts showed how the remaining story points changed during each sprint and allowed the team's progress to be compared with the guideline. Sprint 1 started with approximately 16 story points, while Sprint 2 started with approximately 21 story points. The charts also show that work was completed in noticeable batches rather than through perfectly linear progress. This suggests that the team was able to handle the planned workload, while also showing that actual progress may not always occur at a constant rate.

Note: AI tools were used as a learning aid to understand and explore certain Jira features.
